COMBUSTION ENGINEERING

Scope Note: Here are entered works on Combustion Engineering and other related topics.

Combustion Engineering– an application of engineering disciplines (principally mechanical and chemical engineering) to the conversion of fuels into useful forms of energy through the use of combustion processes. Combustion engineering involves the design, construction, and operation of utility and industrial power plants, process industry kilns and furnaces, and a host of similar facilities designed to supply and use fuels. Combustion is the dominant means for converting the potential energy, typically measured in Btu or kilocalories, contained in solid, liquid, and gaseous fuels into useful energy forms.
